SUMMARY

I am a software developer with a background in .NET/C#, Node.js, SQL and PostgreSQL. Most of my work sits behind the interface: backend modules and APIs, database modelling, and the validation that keeps bad data out of a system.

I started in 2020 maintaining and extending Laravel applications for client projects, including feature work, fixes and User Acceptance Testing. Since 2021 I have been building internal business applications that support daily operational processes across departments.

In 2025 I received 1st place in an internal company innovation program for an automation workflow that digitised manual invoicing. That project summarises what I enjoy: removing a repetitive process and replacing it with something reliable.

Alongside that, I continue to deepen my backend work in Node.js — API design, database schema and migrations, automated tests, and treating error handling as a feature rather than an afterthought. The projects below are the public evidence.

TECHNICAL SKILLS

PROFESSIONAL BACKGROUND	C# / .NET (ASP.NET, .NET Core) · Node.js · SQL Server / PostgreSQL / MySQL · Laravel / PHP · JavaScript / TypeScript · RESTful APIs · Git · Business process automation · User Acceptance Testing
DEMONSTRATED IN PUBLIC PROJECTS	Express · TypeScript · Drizzle ORM · SQLite · Vue 3 · OpenAPI 3.1 · Postman · node:test · Python / pandas
CURRENTLY DEVELOPING	Node.js backend architecture · Testing depth · Python for data analysis

SELECTED PROJECTS

sembarang-budal https://github.com/yussyafridayusfi/sembarang-budal

A place-search app that answers from a local cache, so it keeps working when free map APIs do not.

— Cache-first search answers from SQLite in milliseconds and keeps working while upstream APIs are unavailable
— Coverage is tracked per category, so a category that timed out is retried instead of cached as empty

Stack: Vue 3, Vite, Express, SQLite, Leaflet, OpenStreetMap, Vercel

---

HealthLogHistory https://github.com/yussyafridayusfi/HealthLogHistory

A WhatsApp-to-spreadsheet pipeline that parses health readings deterministically and never logs the same message twice.

— Deterministic line parser with key aliases; ambiguity produces a warning rather than a guess
— Idempotency keyed by message id, recorded only after a successful append, so a Sheets outage leaves the message retryable

Stack: Node 22, TypeScript, Baileys, Google Sheets API, OpenAPI 3.1, Postman, node:test

---

summary-podcast https://github.com/yussyafridayusfi/summary-podcast

Private podcast notes per visitor, with no sign-up.

— Schema with a UUID primary key and time-zone-aware timestamps, generated as committed SQL migrations
— Generic CRUD router with explicit 400 / 404 / 201 / 204 responses and input validation before the data layer

Stack: Node 24, Express 4, TypeScript, Drizzle ORM, PostgreSQL, Vue 3, Vite

---

Simple-Laravel-Api https://github.com/yussyafridayusfi/Simple-Laravel-Api

A compact Laravel REST API with token authentication and a validated project resource.

— Register and login with request validation, hashed passwords and token issuance on success
— Resource controller for list, create, read, update and delete, protected by auth middleware

Stack: PHP, Laravel, Eloquent, Token authentication, SQL migrations

---

Spotify-EDA-TaylorSwift https://github.com/yussyafridayusfi/Spotify-EDA-TaylorSwift

A pandas notebook exploring how Spotify audio features change across release years.

— Data preparation before analysis: null checks, datetime parsing, a derived release year and milliseconds converted to seconds
— Correlation heatmap across audio features, then grouped line charts of feature averages per year

Stack: Python, pandas, NumPy, matplotlib, seaborn, NLTK, WordCloud, Jupyter
